# Data Visualization

### Agenda

- 1. Some Notes
- 2. Magic Functions

- 3. Line Plot
- 4. Area Plot
- 5. Pie Chart
- 6. Questions

# Some Notes

#### Notes 1

- To import an individual <u>function</u> or <u>class</u> from a module:
  - from module\_name import object\_name
- To import multiple individual <u>objects</u> from a module:
  - from module\_name import first\_object, second\_object

- To rename a module:
  - import module\_name as new\_name
- To import an <u>object</u> from a module and rename it:

from module\_name import object\_name as new\_name

#### Notes 2

- To import every object individually from a module:
  - o from module\_name import \*
    - DO NOT DO THIS
- To use all of the objects from a module, use the following:
  - import module\_name
    - And access each of the objects with the dot notation.

#### Pandas

• Plotting in Pandas is simple

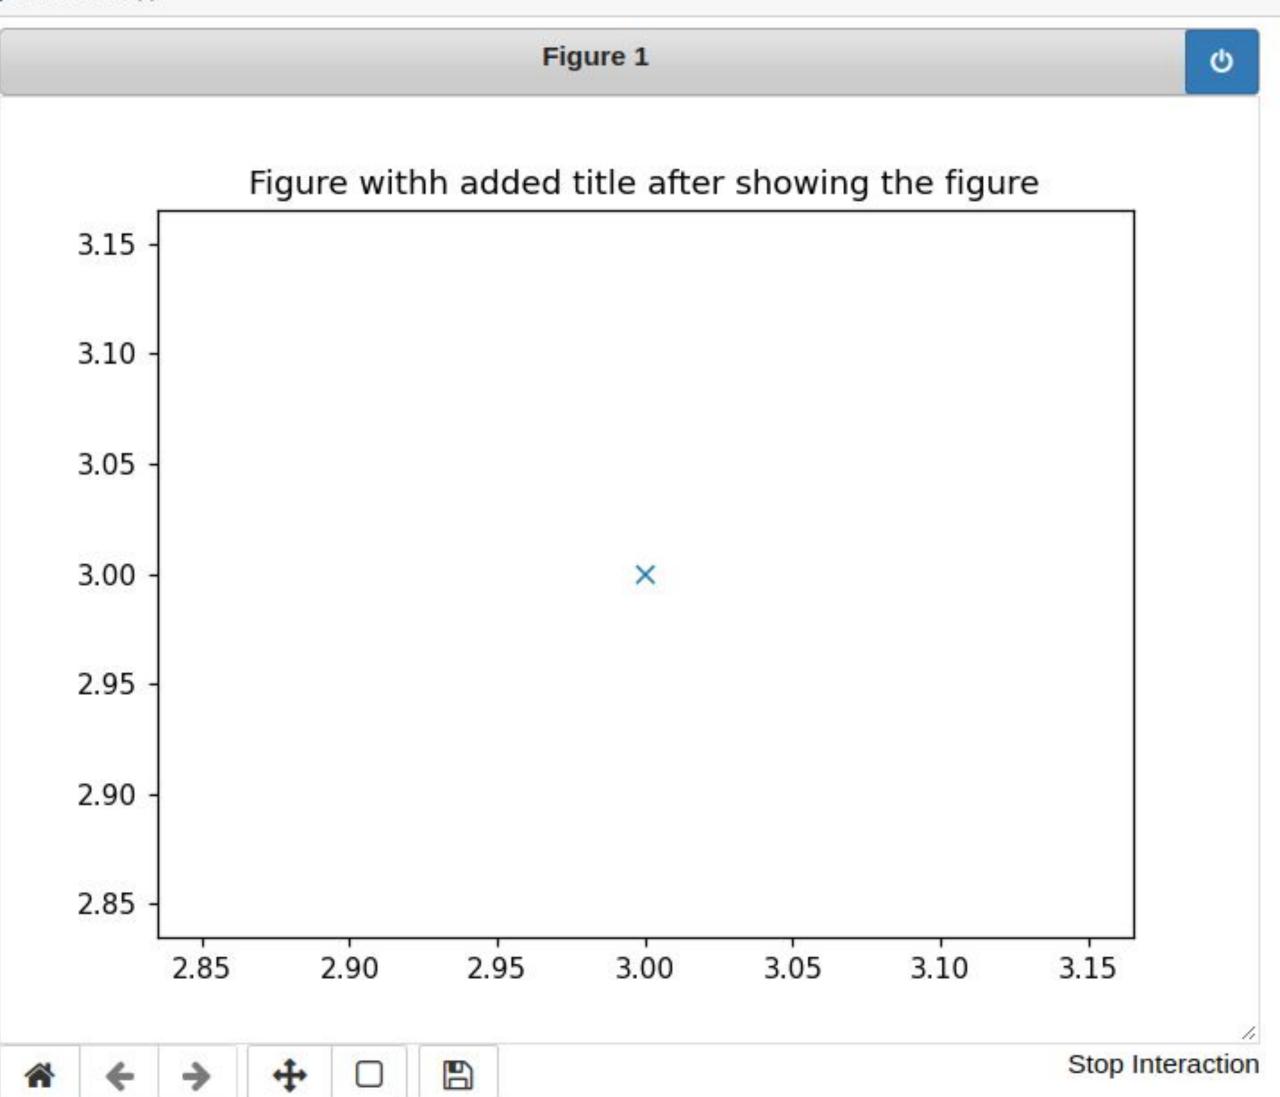

- to generating a histogram:
  - o call the plot function on a given column of a Pandas dataframe

- set the parameter kind to hist
- to generating a line plot:
  - o call the plot function on a given Pandas dataframe
  - set the parameter kind to line

# Magic Functions

# Matplotlib Plot Function

```
In [1]: %matplotlib notebook
   import matplotlib.pyplot as plt
   plt.plot(3,3,'x')
   plt.show()
```

```
In [2]: plt.title('Figure withh added title after showing the figure')
```

Out[2]: Text(0.5, 1.0, 'Figure withh added title after showing the figure')

### Magic Functions

• Python calls them on our behalf in specific circumstances.

Have this name to distinguish them from other functions

### Magic Functions use with Matplotlib

- A limitation: we cannot modify a figure once it's rendered
- Matplotlib has a number of different backends available
  - Example for backend: %matplotlib notebook
    - A backend that overcomes this limitation is the notebook backend
    - if an active figure exists, any function we call will be applied to this active figure
    - If a figure does not exist, any function we call will render a new figure

# Line Plot

#### Line Plot

- Common in many fields, not just data science
- One of the most basic types of plot
- Displays info
  - o as a series of data points (markers) connected by straight-line segments

#### • When to use?

- best use case: continuous dataset to be visualized over a period of time
- Example: Plotting the trend of immigrants from Haiti to Canada over time

```
In [1]: import pandas as pd

df = pd.read_csv('canada-mig-dataset.csv')

df.head()
```

```

#### Out[1]: <AxesSubplot:>

## Area Plot

### Area Plot (Area Chart or Area Graph)

• is an extension of (based on) the line plot

• depicts accumulated totals using numbers/percentages over time

is commonly used when trying to compare two or more quantities

```
In [1]: import pandas as pd

df = pd.read_csv('canada-mig-dataset.csv')

df.head()
```

    df4.plot(kind='area')
```

#### Out[1]: <AxesSubplot:>

Use: axis=0 in sort\_values()

## Pie Chart

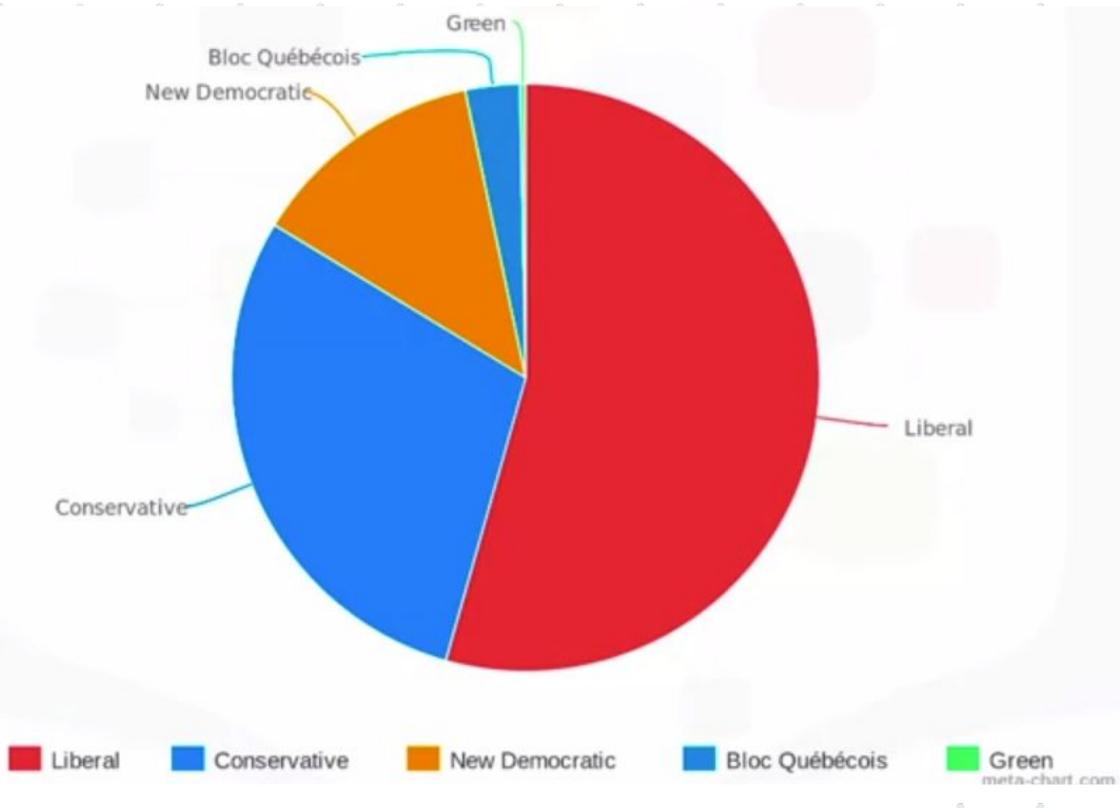

#### Pie Chart

- is a circular statistical graphic
  - divided into slices
  - to illustrate numerical proportion

#### • Example

- the Canadian federal election in 2015
- were Liberals in red won more than 50% of the seats in the House of Commons

- There are some very vocal opponents to the use of pie charts
  - Most argue that pie charts fail to accurately display data with any consistency

```
In [1]: import pandas as pd

df = pd.read_csv('canada-mig-dataset.csv')

df.head()
```

```

## Pie Chart - Complete Example

```
In [1]: import pandas as pd
import matplotlib.pyplot as plt

df0 = pd.read_csv('canada-mig-dataset.csv')
df0['Total'] = df0.iloc[:, 9:43].sum(axis=1)
df1 = df0.groupby('AreaName', axis = 0).sum()
df2 = df1.head(6)
df2['Total'].plot(kind='pie')

plt.title('Immigration to Canada by Continent [1980 - 2013]')
plt.show()
```

Immigration to Canada by Continent [1980 - 2013]

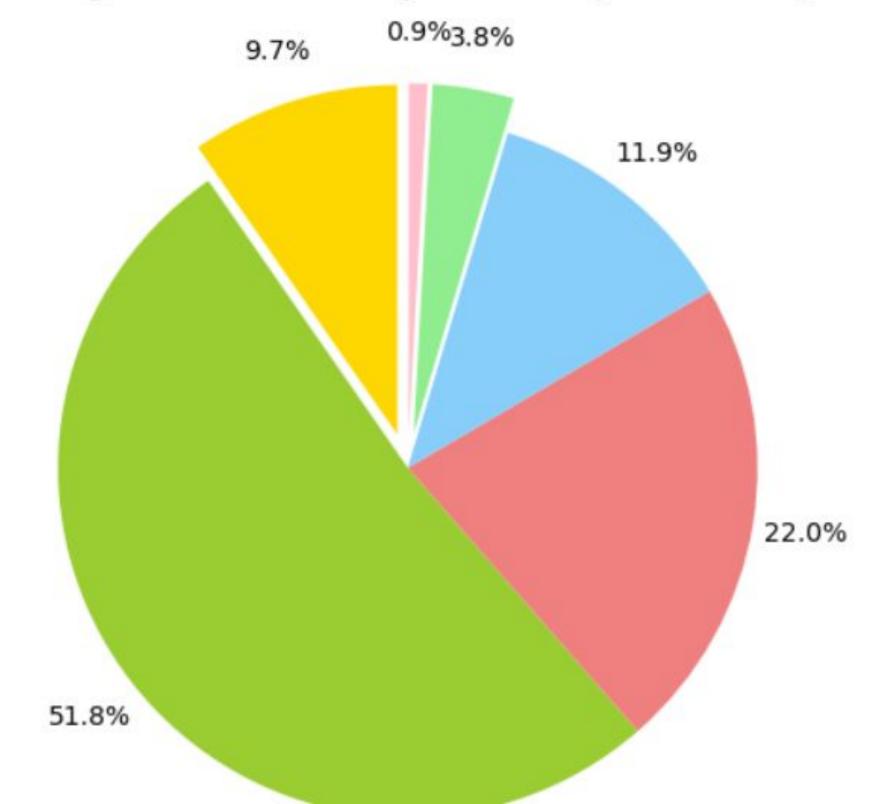

# Pie Chart Example Enhancement

```
colors_list = ['gold', 'yellowgreen', 'lightcoral', 'lightskyblue', 'lightgreen', 'pink']
explode list = [0.1, 0, 0, 0.1, 0.1] # ratio for each continent with which to offset each wedge
df2['Total'].plot(kind='pie',
           colors = colors list, # Add custom colors
           explode = explode list, # 'Explode' the lowest 3 continents
           figsize = (10, 6), # A tuple (width, height) in inches represents the size of a Figure object
           startangle = 90,
                                 # Start angle: 90° (Africa)
                                 # Turn off labels
           labels = None,
           pctdistance = 1.15,  # Ratio between center of each slice and start of text generated by autopct
           autopct = '%.1f%%',
                                 # '%.1f' to show one float point while '%%' to show '%' (double '%%' to skip)
plt.title('Immigration to Canada by Continent [1980 - 2013]', pad=15) #Title offset from the top of the axes in points
plt.legend(labels = df2.index, bbox to anchor = (0, 1))
plt.ylabel("")
plt.show()
```

# Africa Asia Europe Latin America and the Caribbean Northern America Oceania

#### Immigration to Canada by Continent [1980 - 2013]

#### Pie Chart Notes 1

- Limit the number of slices plotted
- A pie chart works best with two or three slices
  - o It's possible to plot four/five slices as long as the wedge sizes can be distinguished

- If we have
  - many categories or
  - categories with small representation
  - we can
    - re-group them together so that fewer wedges are plotted, or
    - use an 'Other' category to handle them

#### Pie Chart Notes 2

- One typical method of plotting a pie chart
  - Start from the top of the circle,
  - then plot each categorical level clockwise from most frequent to least frequent
- If you have three categories and are
  - interested in the comparison of two of them
    - You may place the two categories on either side of the 12 o'clock direction
    - with the third category filling in the remaining space at the bottom

#### Donut Chart

Use its hole to make use of available space better (add statistics)

#### Pie Chart vs Bar chart

- There are some very vocal opponents to the use of pie charts
  - Most argue that pie charts fail to accurately display data with any consistency
- Bar charts are much better when it comes to representing the data in a consistent way and getting the message across
